Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

RESULT 12
T43262
calcium channel alpha-1 chain, L-type - Stylophora pistillata
C;Species: Stylophora pistillata
C;Species: Stylophora pistillata
C;Date: 11-Jan-2000 #sequence_revision 11-Jan-2000 #text_change 09-Jul-2004
C;Accession: T43262
R;Zoccola, D.; Tambutte, E.; Senegas-Balas, F.; Michiels, J.F.; Failla, J.P.; Jaubert, J. Gene 227, 157-167, 1999
A;Title: Cloning of a calcium channel alpha! subunit from the reef-building coral, Stylog A;Reference number: Z22375; MUID:99148007; PMID:10023047
A;Reference number: Z22375; MUID:99148007; PMID:10023047
A;Accession: T43262
A;Status: preliminary; translated from GB/EMBL/DDBJ
A;Molecule type: mRNA
A;Residues: 1-1891 <ZOC>

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Talcum channel.";

Nature 391:896-900(1998).

Calcium channels (VSCC) mediate the entry of calcium dependent processes, including muscle in a variety of calcium-dependent processes, including muscle contraction, hormone or neurotransmitter release, gene expression, cell motility, cell division and cell death. The isoform alpha-1G gives rise to T-type calcium currents. T-type calcium channels belong to the "low-voltage activated (LVA)" group and are strongly blocked by mibefradil. A particularity of this type of channels is blocked by mibefradil. A particularity of this type of channels is an opening at quite negative potentials and a voltage-dependent inactivation. T-type channels serve pacemaking functions in both central neurons and cardiac nodal cells and support calcium signaling in secretory cells and vascular smooth muscle. They may also be involved in the modulation of firing patterns of neurons which is important for information processing as well as in cell
                                                                                                                                                                                                                                                                                                                                              MEDLINE=98154730; PubMed=9495342;

SUBCELLULAR LOCATION: Integral membrane protein.
TISSUE SPECIFICITY: Highly expressed in brain. Moderate expression in heart; low expression in placenta, kidney and lung.
DOMAIN: Each of the four internal repeats contains five hydrophobic transmembrane segments (S1, S2, S3, S5, S6) and one positively charged transmembrane segment (S4). S4 segments probably represent the voltage-sensor and are characterized by a series of positively charged amino acids at every third position. PTM: In response to raising of intracellular calcium, the T-type channels are activated by CaM-kinase II.

                                                                                                                                                                                                                                                                                                                                                                                                                                   -!- FUNCTION: Voltage-sensitive calcium channels (VSCC) mediate the entry of calcium ions into excitable cells and are also involved in a variety of calcium-dependent processes, including muscle contraction, hormone or neurotransmitter release, gene expression, gives rise to T-type calcium currents. T-type calcium channels belong to the "low-voltage activated (LVA)" group and are strongly blocked by nickel and mibefradil. A particularity of this type of channels is an opening at quite negative potentials, and a voltage-dependent inactivation. T-type channels serve pacemaking functions in both central neurons and cardiac nodal cells and support calcium signaling in secretory cells and vascular smooth muscle. They may also be involved in the modulation of firing patterns of neurons which is important for information processing as well as in cell growth processes.

-!- SUBCELLULAR LOCATION: Integral membrane protein.
-!- TISSUE SPECIFICITY: Expressed in brain.
-!- DOMAIN: Each of the four internal repeats contains five positival. Locations for the four internal repeats contains five bositival.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This SWISS-PROT entry is copyright. DOMAIN: Each of the four internal repeats contains five hydrophobic transmembrane segments (S1, S2, S3, S5, S6) and one positively charged transmembrane segment (S4). S4 segments probably represent the voltage-sensor and are characterized by a probably represent the voltage sensor and are characterized by a series of positively charged amino acids at every third position. PTM: In response to raising of intracellular calcium, the T-type channels are activated by CaM-kinase II.

SIMILARITY: Belongs to the calcium channel alpha-1 subunits

"Usumitted (JAN-2001) to the EMBL/GenBank/DDBJ databases.

"Le "UnCTION: Voltage-sensitive calcium channels (VSCC) mediate the entry of calcium ions into excitable cells and are also involved in a variety of calcium-dependent processes, including muscle contraction, hormone or neurotransmitter release, gene expression, cell motility, cell division and cell death. The isoform alpha-IH gives rise to T-type calcium currents. T-type calcium channels belong to the "low-voltage activated (LVA)" group and are strongly blocked by nickel and mibefradil. A particularity of this type of channels is an opening at quite negative potentials, and a voltage-dependent inactivation. T-type channels serve pacemaking functions in both central neurons and cardiac nodal cells and support calcium signaling in secretory cells and vascular smooth muscle. They may also be involved in the modulation of firing as well as in cell growth processes.

CAUTION: AT-AC pre mRNA splicing gives rise to the isoform 1 shown in this entry. The additional 20 amino acids found in the Ref.4 and Ref.6 sequences are due to a misunderstanding of the real type
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Name=2; Synonyms=AlH-b;
Isold=095180-2; Sequence=VSP 000949;
Isold=095180-2; Sequence=VSP 000949;
TISSUE SPECIFICITY: Expressed in kidney, liver, heart, brain.
Isoform 2 seems to be testis-specific.
DOMAIN: Each of the four internal repeats contains five hydrophobic transmembrane segments (S1, S2, S3, S5, S6) and one positively charged transmembrane segment (S4). S4 segments probably represent the voltage-sensor and are characterized by a series of positively charged amino acids at every third position. PTM: In response to raising of intracellular calcium, the T-type channels are activated by CaM-kinase II.
SIMILARITY: Belongs to the calcium channel alpha-1 subunits
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Alternative splicing; Calcium channel; Calcium-binding; Glycoprotein;

Res. 6:329-336(1999).

FUNCTION: Voltage-sensitive calcium channels (VSCC) mediate the entry of calcium ions into excitable cells and are also involved in a variety of calcium-dependent processes, including muscle contraction, hormone or neurotransmitter release, gene expression, cell motility, cell division and cell death. Isoform alpha-11 gives rise to T-type calcium currents. T-type calcium channels belong to the "low-voltage activated (LVA.)" group and are strongly blocked by nickel and mibefradil. A particularity of this type of channels is an opening at quite negative potentials, and a

C entry of calcium-dependent processes, including muscle contraction, hormone or neurotransmitter release, gene expression, cell motility, call division and cell death. Isoform alpha-li gives rise to T-type calcium currents. T-type calcium channels belong to the "low-voltage activated (LVA)" group and are strongly blocked by nickel and mibefradil. A particularity of this type of channels is an opening at quite negative potentials, and a voltage-dependent inactivation. T-type channels serve pacemaking tunctions in both central neurons and cardiac nodal cells and voltage-dependent inactivation. T-type channels serve pacemaking functions in both central neurons and cardiac nodal cells and support calcium signaling in secretory cells and vascular smooth muscle. They may also be involved in the modulation of firing patterns of neurons which is important for information processing as well as in cell growth processes. Gates in voltage ranges similar to, but higher than alpha 1G or alpha 1H.

L' SUBCELLUIAR LOCATION: Integral membrane protein.

L' TISSUE SPECIFICITY: Brain.

L' DOMAIN: Each of the four internal repeats contains five hydrophobic transmembrane segments (S1, S2, S3, S5, S6) and one probably represent the voltage-sensor and are characterized by a probably represent the voltage-sensor and are characterized by a series of positively charged amino acids at every third position.

L' SIMILARITY: Belongs to the calcium channel alpha-1 subunits

C' Hannels are activated by CaM-kinase II (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This SWISS-PROT entry is copyright.
